TITLE : LIQUID CRYSTAL DISPLAY DEVICE

**ABSTRACT :** PROBLEM TO BE SOLVED: To make it possible to sufficiently decrease the flickers of a screen and to improve display quality by covering the side opposite to the display side of the device with a metallic sheet.

**SOLUTION:** The metallic sheet MS coated with a conductive tacky adhesive layer EA over the entire surface is stuck to the rear surface of a liquid crystal display module MDL. Namely, the metallic sheet MS is stuck via the conductive tacky adhesive layer EA to the rear surface of a lower case MCA and the three ends of the metallic sheet MS are bent at the points of bending lines FL of alternate long and short sash lines and are superposed on the three flanks of a metallic shielding case SHD and are stuck via the conductive tacky adhesive layer EA. The rear surface of the liquid crystal display module MDL is covered by the metallic sheet MS in such a manner, by which the shieldability of the liquid crystal display module MDL is enhanced. Consequently, the flickers of the screen may be decreased.
